CASE STUDY · CRESTLINE · CURVE + LATERAL

ONE RUN. NO TRIPS. 4.5 DAYS BACK.

Crestline needed a curve and a 10,500 ft lateral. We drilled both with a single bottom hole assembly, without tripping once, and handed the well back four and a half days ahead of plan.

1
run for the curve and the lateral, with one BHA

92 ft/hr
average rate of penetration in the lateral

15%
faster than the offset wells around it

4.5 days
ahead of Crestline's plan

DRAFT V0 · NUMBERS TO VERIFY

WHY IT MATTERS

THE CHEAPEST DAY IS THE ONE YOU DON'T NEED.

A lower day rate is a discount. Fewer days is a saving. On Crestline's well, keeping the curve and the lateral in one run removed the trips that usually eat days on this interval.

THE ASK

Drill the curve and a lateral of about 10,500 ft for Crestline, on an interval where a trip between the two is normal.

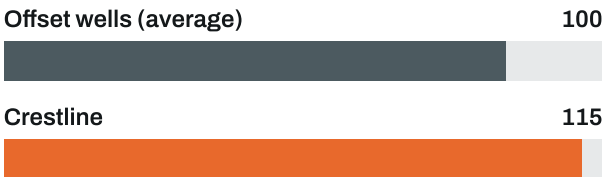

WHAT WE DID

Drilled the curve and the full lateral with one bottom hole assembly in a single run. No trips.

THE RESULT

Average lateral ROP of 92 ft/hr, about 15% faster than the offset wells, and the well finished 4.5 days ahead of plan.

SPEED VS. OFFSET WELLS

Indexed: offset average = 100. Offset list and metric confirmed from the run report before print.

DAYS VS. PLAN

Bar lengths drawn to scale once planned and actual days are confirmed.
